Colors and Boxes in LaTeX

Vikram Mehra

November 11, 2026

1 Introduction

LaTeX supports colored text, backgrounds, borders, and customized boxes using the xcolor package.

2 Changing Text Color

The textcolor command changes the color of selected text.

This is red text.
This is blue text.
This is custom green text.

3 Defining Custom Colors

The definecolor command creates a new color.

This text uses a custom blue color.
This text uses a custom green color.

4 Creating a Colored Background

The colorbox command places a colored background behind text.

Text with a yellow background.

Text with a custom background.

5 Creating a Colored Border

The fcolorbox command creates a box with a colored border and background.

LaTeX Colored Box

This is a customized box containing multiple lines of text. It demonstrates how LaTeX can combine colored borders and backgrounds.

6 Changing the Text Color of a Section

This complete paragraph is displayed in custom blue. The color declaration remains active within its braces.

7 Conclusion

The xcolor package provides useful commands for customizing documents with text colors, background colors, and colored boxes.
